EXPERIENCE

Limesharp Internet Ltd., London, UK — *Front End Developer*

August 2022 - Present

I would consider this as the major leap forward in experience and knowledge in my career, as Limesharp is an eCommerce agency that gave me the opportunity to work on a large variety of tasks in different environments, collectively having the necessary impact on me to improve and develop on different key aspects to continuously grow not only as a front end developer but also as a person and individual in a more team-focused environment.

- Developed, maintained, and shipped production code for client websites primarily using HTML, CSS, SASS, Tailwind, JavaScript, and Vue.js
- Performed quality assurance tests on various sites to ensure cross-browser compatibility and mobile responsiveness
- Clients included ME+EM, Brora, Jo Loves, GF Smith, and more

Generazia d.o.o., Kakanj, BA — *Front End Developer*

January 2021 - May 2022 (~1.5 years)

Started working here as I liked to learn more about web development, especially the front-end aspect. My duties were simple but also challenging as I was tasked with creating front-end components which I enjoyed doing on a daily bases. Started and left with a smile on my face to find a more challenging position to progress on this career path.

SELECTED PROJECTS

Audiophile E-Commerce

Being an e-commerce-type website, I had to think strategically so all the parts and components would work together firmly. This project gave me the opportunity to learn crucial skills regarding any shop or sales-related website, on custom components to order confirmation.

SKILLS

Html

Css

Javascript

React

Vue

Tailwind CSS

Sass

Git

SOFT SKILLS

Critical thinking

Problem-solving

Teamwork and collaboration

Troubleshooting

Observation

Resourcefulness

Self-management

Willingness to learn

Positive attitude

Research and Analysis

Digital Design

Digital Design is a heavy style and animation-sided website where critical styling and animating skills have been established. A massive contributor to where the learning accomplishments came from is that the code for styles and animations is custom written and developed by myself in the React framework.

Trillow Real Estate

This project represented quite a unique set of challenges for me at that time. I was faced with problems regarding an unreliable API presented to me. To overcome these obstacles, I had to make many assumptions as well as double and triple-checking when it comes to the properties provided by the given API.

Superchat

This project taught me a lot about handling client and back-end interactions. Consisting of two pages, superchat was custom designed and developed by myself to accomplish the main criteria of users being able to interact with each other.

Weather App

As a weather application, the criteria was to use the proper API to accurately show and inform the user about the weather conditions, either based on your location or a user-selected location, with also the aspect of two different layouts and a plethora of different looks depending on the weather cast at hand.
